Brachyotus holioyana; C.

Aug. 1, 1907, on Igorki
brought me a female which
he had saved on its nest.

He also brought the nest, which
contained one (1) egg 24×16.5
General color of egg grayish brown
ground greenish gray-brown, thick
and uniform, covered with brown
absorbing the ground color; root
end nearly all brown.

Nest built of moss, lined
with broad grass blades, skeleton
leaves and fine rootlets.

external diameter 140.

internal " 55

external depth 110

internal " 85

Brachyotus is one of the
most elusive birds that I have
met with. One will dart
across the land and alight
in one of the tangles of brushwood
and fallen timber that it
delights to inhabit. The instant
it alights it hops to a lower
level where its sitting tail
appears for an instant like
the flashing twitch of a Parula
song tail as it changes color
and ^{and solicits as it} disappears into its
bush. One awaits in vain
its reappearance; for the
chances are in favor of its
being far down the hillside
inspecting the hollow of some
decayed stump. Most of my
specimens have been taken in
small traps baited for man:

=mals with a touch of satin.
It is especially usually
placed in hollows of young
trees or among crevices of
rocks. It is crepuscular,
its ^{chief} notes being
up and down the scale as it
dusk, when it is much more
apt to appear at road than
during the hours of sunshine.
It is never seen less than
than a yard above the ground,
on which it runs at an
amazing pace.

Pseudotharrhaleus. - This bird inhabits the most intricate and darkest spots in the affine forests. It is more easily shot than Brachypteryx, because it does not forsake its haunts when approached, and

because its rough rasping
chirp, followed by a low
trill is continually heard,
as the bird continually
moves about the island.
I have sat for half an hour
awaiting an opportunity for
a shot, but so minutely does
it run upon the ground and
branches of its bushy home
that it is as difficult to
shoot as a forest mouse.
It utters a loud, clear song
at rare intervals.

A nest, supposed to be of this bird was discovered at a mass of moss ~~4 ft~~ growing upon a tree-trunk about 4 feet above the mossy turf at the apex of Mt. Malindang. This nest was preserved. It was empty.

Prioniturus montanus - The
 red-crown'd. It utters a
 squeaky sound like that of a
 rusty wheelbarrow. Its cry
 of oo'-lee, is a soft note
 which is its favorite sound.
 It has a variety of harsh notes
 the loudest being the notes of
 alarm when it takes sudden
 flight. Its ^{flight} notes are
 much softer utterances
